

Did you know :

Toilet use is the largest source of water consumption in your home, but it also offers significant potential for water savings.

Replace your standard toilet with a WaterSense-certified or low-flow toilet. A family of four can save **more than 60,000 liters of water** per year by making this choice.

Repairing a leaky toilet will prevent large amounts of water from being wasted. A leaky toilet can use up to **550 liters** of drinking water per day, which can double your daily water consumption.

Some leaks make a noise that can be heard, but others are silent. To determine if a toilet is leaking, pour two or three drops of food coloring into the tank. If the water in the bowl becomes colored after a few minutes, there is a leak. In most cases, a leak can be repaired at little cost.
